

Following are the high level steps, that we perform in our application:

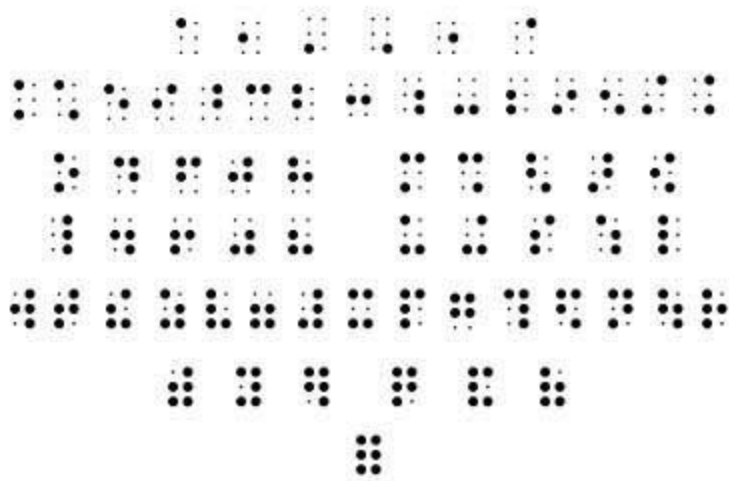

1. Taking a Braille printed paper.

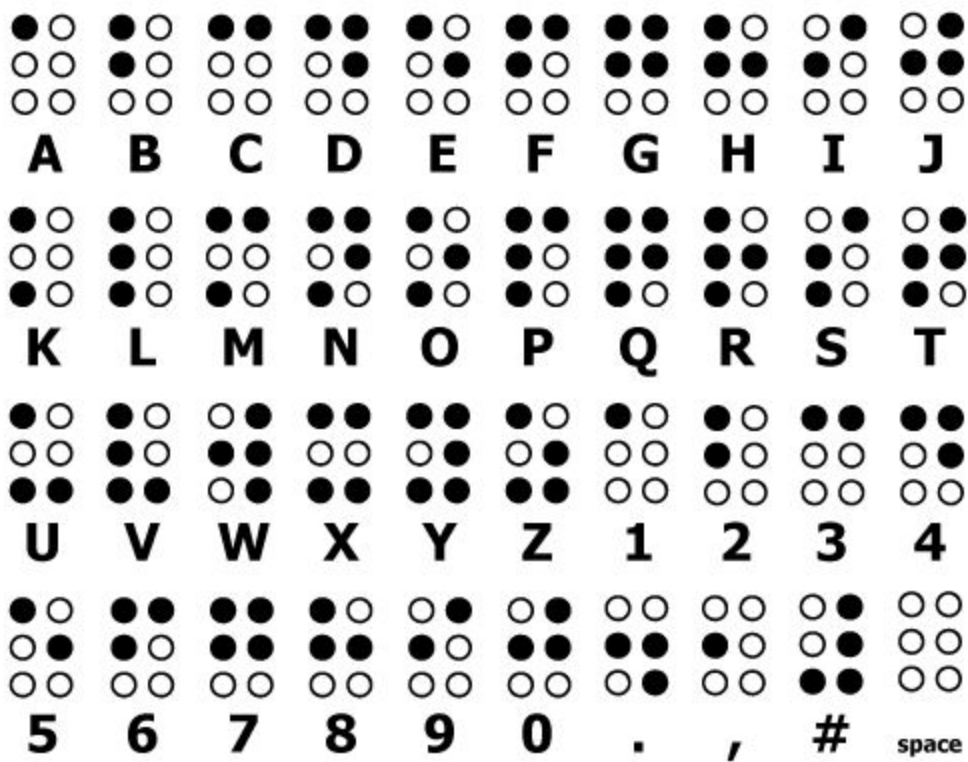

2. Scanning the paper using the app created by us.

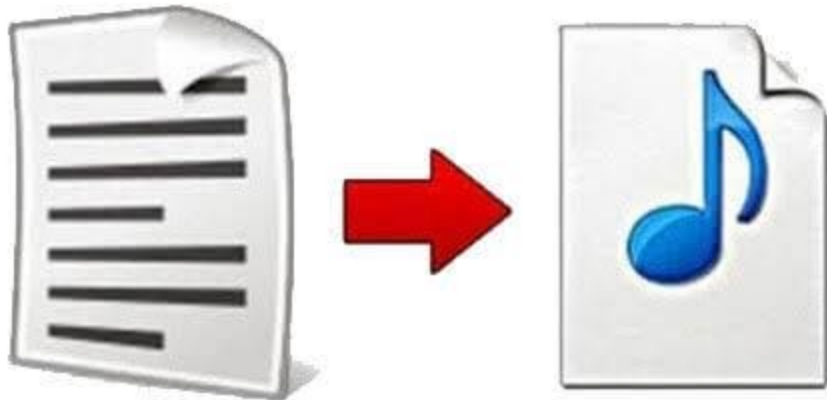

3. After scanning, getting and understanding the Braille code in it.

4. Converting the scanned Braille code to a Language(for example Englis).

5. Converting the Language text to speech(saving it as an audio file).

Text To Speech

6. Giving this audio file to the Blind people, so that they can hear it.

By using this application, we can eliminate human process of reading(touch and recognizing the letter) Braille code. With this application, we can directly convert the Braille code to an audio file which can be used in several ways.
